This study investigates the relationship between self-efficacy, self-regulated learning strategies, self-esteem, and personality traits. The results of the study suggest that self-efficacy is positively influenced by self-regulated learning strategies and self-esteem, and negatively influenced by personality traits.
ABSTRACT: Emotional intelligence can be considered as the ability to understand and control the emotions in order to help the individual to make the best decision in different situations. It is a capacity that is composed of self-awareness, self-management, social awareness, and organizing the relations. The correlation of emotional intelligence and job involvement can be seen as a process in which the individual is aware of their emotional state, manages their emotions effectively, is sensitive to the emotions of others, and organizes relationships with others to maximize their performance in the workplace. This research examined the relationship between emotional intelligence and job involvement. The findings suggest that emotional intelligence is positively correlated with job involvement, indicating that individuals who are emotionally intelligent are more involved in their work. The study highlights the significance of emotional intelligence in the workplace and its potential to enhance job satisfaction and performance.

Key words: Emotional Intelligence, Self-Awareness, Self-Management, Social Awareness, Organizing The Relations, Working Environment, Job Involvement.
Impact of the Second Teacher (Teacher Contributor) On the Academic Achievement of Students in Mathematics
